

## TEMPERATURE-SENSITIVE LIPOSOMAL FORMULATION

### Abstract

A liposome contains an active agent and has a gel-phase lipid bilayer  
5 membrane comprising phospholipid and a surface active agent. The phospholipids are  
the primary lipid source for the lipid bilayer membrane and the surface active agent is  
contained in the bilayer membrane in an amount sufficient to increase the percentage  
of active agent released at the phase transition temperature of the lipid bilayer,  
compared to that which would occur in the absence of the surface active agent. The  
10 surface active agent is present in the lipid bilayer membrane so as to not destabilize  
the membrane in the gel phase.
